Introducing Blue

Blue is a powerful survey tool designed to give you the ability to gather huge amounts of data that provide insights to help you and your organization evolve and improve. What sets Blue apart is its capacity to customize and manage surveys for thousands of events happening at different times, while handling all the data collected, managing dynamic schedules, and automatically distributing the results.

Blue expertly handles the most popular feedback initiatives, from learner feedback on instruction to employee engagement in the workplace.

Figure 1: Employee journey

Through best-in-class integration, powerful automation, a robust reporting engine and interactive dashboards, Blue ensures that you not only capture feedback but are able to turn it into valuable insights that can be used to enhance the experience of all those involved in the learning process.

Planning the feedback collection process

Before you start implementing Blue, explore the following questions that will help you create a solid data foundation for collecting feedback and, in turn, produce insightful results.

What is the goal of your feedback collection process?

It is important to know why you are gathering feedback. For example, will you be using the aggregate results of a 360 review evaluation to determine your organization's skills readiness for launching a new project or service, or the individual results to create employee training plans to improve their productivity and job satisfaction? Perhaps you are getting ready to launch professional development plans for your leaders? Each of these initiatives require analyzing the data from different perspectives which is enabled through the inclusion of the right data before surveys are submitted.

Who needs to review the survey results?

To effectively plan the distribution of survey results, you need to know what information should be distributed to who and when. In Blue, these individuals are referred to as Report Viewers. Each project can be configured differently allowing for automated reports with the appropriate data sent to each individual at the right time. Consider what data should be sent to which individuals and when they should receive it.

What survey questions should you be asking?

Constructing a robust, well-vetted questionnaire, combined with demographic data will enable you to develop insightful results. Consider questions used in past evaluations to determine which ones would align with the objectives of your project and which training data would need to be collected to generate the analysis which will be available in project reports and dashboards.

Who and / or what will be evaluated?

Additional training data may be required to provide context to your survey results to better understand their meaning. What data will you need to include in your project?

User Data

- Name
- Employee / Manager ID
- Title
- Role
- Gender
- · ...and so on

Object Data

- Course Name
- · Start and End Dates
- Title
- Course ID
- Department / Location
- ...and so on

When should the feedback collection process start and end?

Most organizations find it difficult to select a single time when everyone involved in the evaluation process is available. Blue allows you to create flexible survey schedules that suit the availability of those involved in the process. In addition, the frequency of these surveys can be aligned with the organization's need for timely data. Multiple surveys can be running concurrently, and all managed separately so you can choose the project's ideal start and end dates. Consider reviewing the list of all of the surveys run each year and determine when the ideal time for each segment of each project should start and end.

What data is available in our current IT systems?

Much of the data needed for your project may already be available in your organization's IT systems. We recommend that you use this data during your implementation. Blue is able to automatically synchronize data with a variety of SIS, HRIS, LMS, etc., at regular intervals, if needed, to ensure that the data remains current. In addition, historical data can be imported into Blue to expand your reporting and analytics capabilities. Blue can also integrate with your existing SSO and LTI authentication frameworks, to make sure that only authorized users can access potentially sensitive information.

NOTE

Contact your Explorance project manager for questions and additional information related to installing Blue and integrating 3rd party systems.

Implementing Blue

The following flow chart displays the process Explorance uses to implement Blue. This approach is structured yet flexible to guide you step by step on how to set up, run and manage your feedback process.

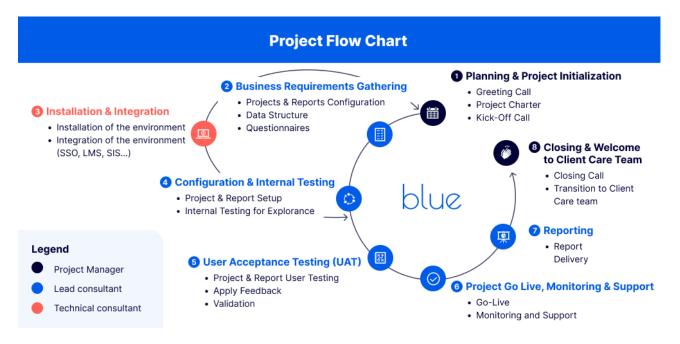

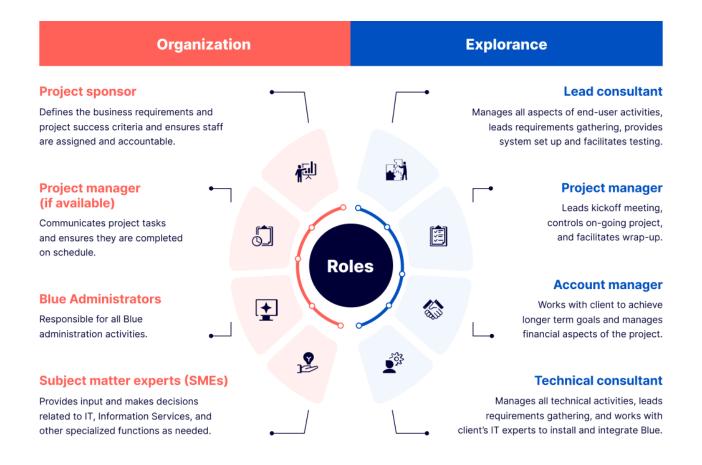

Figure 4: Blue implementation project flow chart

Project teams

Having the right people involved from the very beginning of the feedback process is important. Throughout the life cycle of the project, various stakeholders and team members from different roles and responsibilities will need to be engaged to achieve the project deliverables.

The following diagram displays the roles of the individuals from your organization and Explorance who will be important to the successful implementation of Blue:

Training

It is highly recommended that you identify the individuals who will be your primary Blue administrators and enroll them as early as possible in <u>Blue Administrator Certification</u> (<u>BAC</u>) <u>Training</u>. This will enable them to get up to speed quickly on Blue terminology, concepts, and functionality. A basic understanding of Blue at the start of the implementation process will help your team have more in-depth requirement and solution discussions with the Explorance team members to tailor the implementation to your specific needs.

Implementation safeguards

To avoid potential implementation pitfalls, consider the following suggestions on how to safeguard a smooth Blue implementation:

DEFINE PROJECT OBJECTIVES

If you determine your objectives before or at the beginning of the implementation, you will be in a much better position to deploy meaningful feedback surveys. It is also a good idea to freeze the project requirements ahead of the User Acceptance Testing phase. This will lead to a much smoother implementation with less risk of the need to change direction midstream or to delay the project.

ASSEMBLE PROJECT TEAMS

Assembling the members of your team who will take ownership of Blue and use it to its full potential will prove beneficial to your organization if they are identified and can participate in the project at the beginning of the implementation or as early as possible. Remember to allocate some resources to perform User Acceptance Testing. This phase is one of the most important parts of the implementation to validate the scope of the project. In addition, consider which technical resources from your organization will be required to work with Explorance during the installation of Blue and integration of any 3rd party systems.

GATHER DATA EARLY

Provide sample data as early as possible so that the Explorance team can check to see that all the necessary components for your datasources are included and that it is in the right format to integrate with Blue. In addition, organize the integration of any 3rd party systems that will be connected to Blue at the beginning of the implementation process so that data or user access will be available when needed.

ENGAGE YOUR USERS

Involving your users in advance of the project launch provides many benefits and increases engagement. The following list describes a few activities you could organize to obtain valuable feedback from those who will be completing the surveys, as well as those who will be analyzing the results.

- 1. **Town Hall Meetings**: Organize open-forum meetings where the project team delivers presentations to the user community and takes questions from the audience. This can be a very powerful and rewarding way to connect with the people who are key to the success of the feedback process.
- 2. **Lunch n' Learns**: Set aside some lunch-time sessions for managers and trainers to come and learn about what they will be doing. They might be involved in choosing their own questions or in releasing the evaluations to their employees or learners. Preparing them in advance with some hands-on sessions will help increase their confidence in the use of the system and the overall feedback process.
- 3. **Online Communications Forums**: Email, messaging, social media, and internal websites can be used to communicate with those who did not attend the face-to-face sessions. These are also valuable forums for those who are not comfortable with the direct interaction of in-person meetings.
- 4. **Participation Rewards**: There are many ways to incentivize participation such as drawing for gift cards or free merchandise. You could also provide a certificate with a code for a virtual gift card as a thank you for completing the survey.

Providing continued support

The **Explorance Client Care Team** ensures that you continue to have the assistance you need to maintain your feedback process and to create additional surveys and reports for new projects.

Additional resources

Support

<u>Community resource sharing center</u> - Explore webinars, case studies, documents and blogs shared by other clients on how they use Blue.

Online help - View user guides and best practice recommendations for all Explorance products.

Services

<u>Advanced certification training</u> - Become a product and methodology expert to advance your career.

<u>Consulting services</u> - Get tailored solutions focused on strategy, analysis and change management.

Products

<u>Blue Dashboard</u> - An add-on analytics module that supports data driven decision making at every level of the organization.

<u>Blue Machine Learning</u> - Obtain actionable insights from the analysis of open text comments to discover what matters most to your employees.

DIG - Clean and maintain high quality data in Blue regardless of the original source.

<u>Blue Connector</u> - Integrate Blue with various Learning Management Systems to provide students with access to their surveys, announcements, calendar events and more in the LMS.

<u>Authentication</u> Implement SSO or LDAP to provide single sign on for your users.

<u>Data synchronization</u> - integrate your SIS or HRIS with Blue to provide current user and object data for your projects.
